## To identify the risk factors for Hospital readmissions

- We would like to find risk factors, conditions associated with the hospital readmissions . There is higher cost related to hospital admissions as compared to Physician Office visits. For example , if we can identify and predict diabetic patients requiring hospital readmissions ,then we can target those patients for counselling (about medicine compliance ,diet and exercise).This will reduce the medical costs in the long run and better utilize the hospital resources for more serious illnesses.

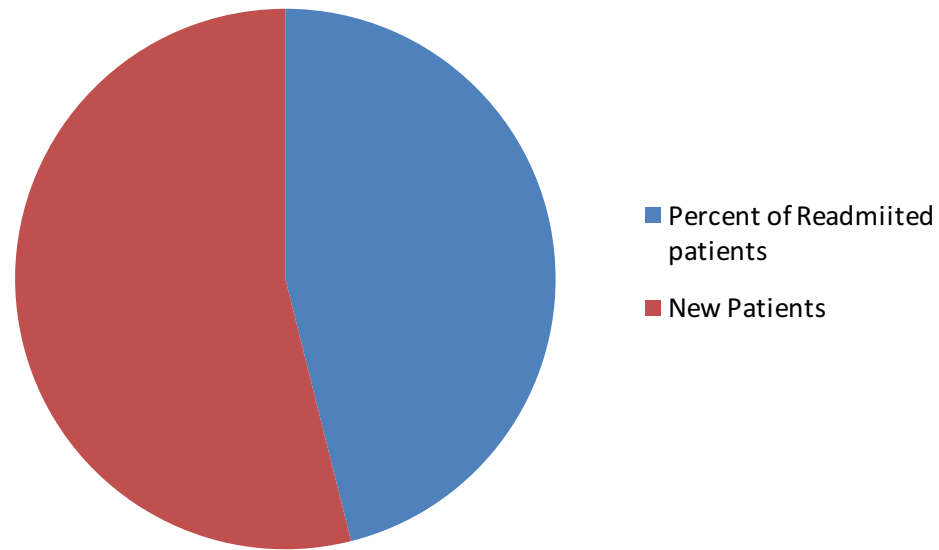

-

## Patients having Diabetic as primary diagnosis

# Hospital Admissions

# Insulin Use of Readmitted Patients
